

How does a wash and dry toilet work?

A wash and dry toilet combines the functions of a bidet and toilet into one unit. After use, the toilet sprays a stream of warm water to cleanse the user, and then an air dryer dries the area, eliminating the need for toilet paper. The water pressure, temperature, and nozzle position can typically be adjusted for comfort. This type of toilet provides a more hygienic, convenient, and eco-friendly alternative to traditional toilets. At EasyCare Systems, we offer wash and dry toilets designed for enhanced comfort and cleanliness.
