

How wide should a ramp be?

At Easy Care Systems, the recommended width of a Rapid Ramp depends on its intended use. For wheelchair users, the minimum width is typically **900mm (3 feet)** to allow comfortable access. However, for public or commercial spaces, a width of **1200mm (4 feet)** or more is often preferred to accommodate larger wheelchairs or multiple users. Our team can help you determine the ideal ramp width based on your needs and the relevant accessibility standards.
